

Statement of Interest — Objective 4 Digital Health Scale-Up

Community-to-facility intelligence interoperable with eCHIS and DHIS2
Your health, our mission.

FairBanks — community health ecosystem rooted in Uganda

I. Statement of Interest

FairBanks Medical Centre and FairBanks Community Reach respectfully submit this Statement of Interest under Objective 4: scaling digital health systems in Uganda. We propose to extend and interoperate community-generated health data — captured by Community Health Workers and Village Health Teams — with national platforms (eCHIS, DHIS2, facility EMRs) through FairBanks Community Health Intelligence Platform (FCHIP).

FairBanks is a Ugandan social enterprise with a functioning medical centre, active outreach in Kampala communities, and established CHW/VHT relationships. We are not proposing a standalone app silo. We are proposing a bridge layer that strengthens Uganda's digital health architecture while keeping communities at the centre of care.

II. Organizational Capacity

- Operating medical centre with pharmacy, diagnostics, and referral pathways
- Community Reach programmes: maternal & child health, Gericare, NCD screening, school health
- Active CHW/VHT networks in Bukoto, Kyebando, Kisaasi, Kamwokya, Kikaaya
- Digital health records foundation and pharmacy dispensing data already in use
- Research partnerships and ethical data governance experience

III. Alignment with Objective 4

Element	Response
Objective 4 intent	Scale EMRs, eCHIS, DHIS2, iHRIS, and national data warehouse capacity
FairBanks response	FCHIP extends last-mile capture and feeds structured community data upstream
Interoperability	API-first exports mapped to DHIS2 indicators; eCHIS-aligned household records
Not a replacement	Complements MoH systems — adds predictive intelligence and community loop closure

IV. Proposed Digital Health Activity

- Deploy offline-capable CHW capture aligned with eCHIS household and visit concepts
- Build secure sync pipeline with role-based access for CHWs, facilities, and district viewers
- Map community indicators to DHIS2 reporting elements for aggregate submission
- Provide facility dashboards for referrals, alerts, and programme monitoring
- Pilot GIS hotspot views to support targeted outreach and supply planning
- Document interoperability specifications for full proposal stage

Community cascade → FCHIP → national systems

V. Interoperability Approach

Platform	Integration pathway
eCHIS	Household registration, visit logs, referral flags — structured mobile capture
DHIS2	Aggregate exports for immunisation, ANC, NCD screening, disease surveillance
Facility EMR	Referral handoff and encounter linkage at FairBanks Medical Centre
National warehouse	Standardised JSON/API feeds when national schema is confirmed

VI. Geographic Focus

- Primary pilot: FairBanks catchment — Kampala-area communities with live CHW operations
- Scalable model: CHW/VHT systems exist nationwide; architecture designed for district replication
- Alignment with MOU geography: Ugandan organisations implementing under national health priorities

VII. Sustainability & Local Ownership

- FairBanks operates the medical centre and outreach without grant dependency for core services
- Revenue pathways: clinic subscriptions, district deployments, NGO programme monitoring, partner APIs
- Local capacity: train Ugandan developers and data stewards; document systems for MoH handoff
- Community ownership: CHWs and leaders co-design forms and alerts — not top-down IT

VIII. Partnership Landscape

- Ministry of Health community health strategy alignment
- District health teams for aggregate reporting validation
- Academic partners for evaluation and interoperability testing
- NGOs and CBOs already working with FairBanks outreach programmes

IX. Readiness for Full Proposal

FairBanks confirms intent to respond to Objective 4 with a community-rooted, interoperable digital health proposal.

Your health, our mission.
